About the Texas State Data Center

The Texas State Data Center (TSDC) is a statewide network of information resources. Its primary purpose is to make census materials and data available to various users interested in demographic information and trends. The Texas State Data Center network is coordinated and administered by the Texas Advisory Commission on Intergovernmental Relations. Inquiries or questions regarding the Commission's work are welcome and should be sent to the above address.

The Continued Slowdown in Texas Population Growth: Post-1980 Population Change in Texas Counties

The slowdown in the Texas economy is impacting nearly all areas of the State. In a report published last year (Murdock and Hwang, 1986), we reported on the first population estimates from the U.S. Bureau of the Census that clearly demonstrated that Texas population growth was also showing a substantial slowdown and that this slowdown was evident in numerous parts of the State. That report, which utilized population estimates for the years 1981-84 (U.S. Bureau of the Census, 1984; 1985), indicated that the annualized rates of population growth in the State from 1982-84 have declined to approximately 60 percent of those which had occurred during 1980-82 and were about one-third slower than that which had occurred during the 1970s. It further indicated that the decline in the rate of population growth in the State was due to a sharp decline in the rate of inmigration into the State from other parts of the Nation and that the slowdown was pervasive--affecting a large number of counties and metropolitan areas in the State.

The purpose of this report is to provide an update of the earlier report by examining patterns of population growth in Texas using the recently released U.S. Census Bureau's 1985 population estimates for the State and for counties in the State (U.S. Bureau of the Census, 1986).[1]

---

[1]The estimates shown for the years 1981-1983 and 1985 are taken from the specific U.S. Census Bureau references cited in the reference section. Estimates for 1984 are taken from revised estimates provided by the Census Bureau to the State Data Center. These estimates for 1984 include, for the first time, an estimate of approximately 49,000 undocumented aliens. Because the U.S. Census Bureau is continuously updating and revising their population estimates, the estimates shown here for the State, Metropolitan Statistical Areas and Counties may differ from those in subsequent documents published by the U.S. Bureau of the Census. In nearly all cases, however, the estimates in different documents for the same area will be very similar and those reported here should be appropriate for most uses.

Specifically, the intent is to address two questions:

1. Did the rate of population growth and net migration in Texas increase or decrease from 1984-85?

2. How has the distribution of population growth and net migration among Texas counties and metropolitan areas changed since 1984?

By addressing these questions, it is possible to discern whether the patterns of slowdown in population growth in the State have continued or intensified or whether renewed and more rapid growth has reappeared. In addition, it is possible from an analysis of these questions to discern which regions of the State and how many areas in the State are experiencing patterns of decline or growth. In sum, the intent is to provide a concise overview of recent patterns of population change in Texas using the most recent data available.

Trends in Statewide Growth

The data in Table 1 indicate that the State's level of population growth continued to decline during 1984-85, from an annual rate of 2.3 percent from 1983-84 to 1.8 percent from 1984-85. Although the State's population was 16.3 million in 1985, more than 2 million more than the population shown in the 1980 Census, its rate of growth from 1984-85 was 21.7 percent less than that from 1983-84 (declining from 2.3 in 1983-84 to 1.8 percent per year during 1984-85). The 1.8 annual rate of growth from 1984-85 was less than one-half of the 3.7 percent annual rate of growth that occurred from 1981-82 and only two-thirds of that which occurred during the 1970s. Thus, the slowdown in Texas population growth became even more apparent between 1984-85 than it had been from 1982-84.

Data in Table 2 show that, just as during the 1982-84 period, between 1984-85, the reason for the continued slowdown in the State's growth was continued decline in the State's level of net inmigration. From 1984-85,

net migration to the State was 101,000 or 0.6 percent. That rate of net migration was less than one-fourth of that between 1981-82 when it was 2.5 percent and only slightly more than one-half of the 1.1 percent rate per year noted for the 1983-84 time period.

It is also evident that net migration is accounting for a decreasing proportion of the State's overall rate of population growth. In fact, from 1984-85, the 101,000 net migrants to the State represented only 35 percent of the State's total population growth compared to 67 percent of the State's total population growth (364,000 of 543,000) from 1981-82 and 58 percent of the average annual population increase (1.7 million of 3.1 million) during the 1970s. Thus, as during the 1960s (Skrabanek et al., 1985), the State's population growth is now largely due to natural increase. In sum, then, an examination of the data in Tables 1 and 2 clearly verifies that the State's rate of population growth has declined due to a precipitous decline in net migration and is now largely due to natural increase. The patterns of slowing population growth and rapidly declining net inmigration previously noted (Murdock and Hwang, 1986) for the 1982-84 time period were accentuated during 1984-85.

Patterns of Population Growth in Texas Metropolitan Areas

Texas metropolitan areas experienced patterns of rapid population growth during the 1970s with annual growth rates of more than 4 percent per year being evident for Austin, Brownsville-Harlingen-San Benito, Bryan-College Station, Houston, and McAllen-Pharr-Edinburg (Skrabanek et al., 1985). Patterns of population growth and net migration for metropolitan areas for various periods in the 1980s are shown in Tables 3 and 4. An examination of the data in these tables reveals that the slowdown in Texas

population growth and in net migration has become increasingly pervasive among the State's metropolitan areas. Thus, although all 26 of the State's Metropolitan Statistical Areas experienced population growth from 1970-80 and from 1980-82, by 1982-84 three metropolitan areas--Beaumont-Port Arthur-Orange, Odessa and Wichita Falls--were experiencing population decline. From 1984-85, a total of 6 metropolitan areas, Abilene, Beaumont-Port Arthur-Orange, Killeen-Temple, Lubbock, San Angelo, and Wichita Falls declined in population. For another 15 areas, annualized rates of growth for the period from 1984-85 were slower than for the period from 1982-84, and for 22 areas, annualized rates of growth for 1984-85 were slower than those from 1980-82. Thus, it is evident that most of the State's metropolitan areas are experiencing patterns of population change that are significantly different than those which occurred during the 1970s and early 1980s.

Such differences are even more evident when patterns of net migration are examined. During the 1970s all metropolitan areas in the State experienced net inmigration. By 1980-82, however, 2 areas, Killeen-Temple and Lubbock were experiencing net outmigration. From 1982-84, the number of metropolitan areas experiencing net outmigration increased to 4--Beaumont-Port Arthur-Orange, Lubbock, Victoria, and Wichita Falls. During 1984-85, the effects of the slowdown have become very evident. For this period, 17 of the State's 26 metropolitan areas experienced net outmigration with rates of net outmigration of more than 1.0 percent being evident in Abilene, Beaumont-Port Arthur-Orange, Killeen-Temple, Lubbock, Odessa, San Angelo and Wichita Falls. Thus by 1984-85, 65.0 percent of the State's major cities were experiencing net outmigration. For those 11 areas that were experiencing net outmigration but not population decline,

natural increase was sufficiently large to compensate for the loss of population due to net outmigration. The data on net migration for Texas Metropolitan Statistical Areas thus clearly suggest that the slowdown in Texas net inmigration has permeated nearly all regions of the State.

Several areas of the State, however, continued to have relatively rapid growth and significant rates of net inmigration through 1985. The two most rapidly growing areas of the State continued to be Austin and Dallas-Ft. Worth. Austin's estimated annual rate of population growth from 1984-85 was 6.9 percent and its annual rate of net migration from 1984-85 was 5.6 percent. Comparable figures for Dallas-Ft. Worth were a population growth rate of 3.9 percent and a net migration rate of 2.7 percent. According to these estimates, other metropolitan areas in the State continuing to experience population growth of over 2.0 percent per year and net inmigration of more than 1.0 percent during 1984-85 were Midland (2.9% population growth and 1.3% net migration), San Antonio (2.5% and 1.3%) and Tyler (2.7% and 1.9%). Although when data become available for periods after 1985 it may be evident that these patterns have changed, the data in this report suggest that the most rapid population growth from 1984-85 continued to be in the central corridor of Texas.

Overall, then, data for Texas Metropolitan Statistical Areas for 1985 show that the State's patterns of reduced population growth and reduced inmigration were clearly evident in the State's major cities from 1984-85. With a few exceptions, most notably Austin and Dallas-Ft. Worth, the State's metropolitan areas were showing substantial declines in overall rates of population growth, and this population growth was due primarily to natural increase.

Population Growth and Net Migration in Counties in Texas

Tables 5 and 6, Figures 1 and 2 and Appendices A, B, and C provide data on patterns of population change, natural increase and net migration in 254 Texas counties for the 1980s. These data suggest that the slowdown in Texas population growth, evident in the 1984-85 data, is producing patterns of change similar to those which occurred in the 1960s, a period of relatively slow population growth in the State. An examination of the data in Table 5 shows that the number of counties in the State experiencing both population decline and net outmigration by 1985 were similar to the number experiencing such patterns during the 1960s. Thus in the 1960s, 146 counties in the State experienced population decline, and 180 had net outmigration, with growth occurring primarily in the State's metropolitan areas. By 1980-82, the number of counties showing population decline had dropped to only 41, and the number with net outmigration was only 57; but from 1984-85, 110 counties again showed population decline and 147 were experiencing net outmigration. The data in Table 6 further suggest that the patterns of the 1960s, which indicated population decline for the State's most rural counties and the most rapid growth for suburban counties, were again evident for 1984-85. By 1985 nonmetropolitan nonadjacent counties were experiencing mean rates and values that indicated both net outmigration and population decline and nonmetropolitan counties adjacent to a metropolitan county were growing very slowly (by less than 1.0 percent per year). Within metropolitan areas, by 1984-85, population growth had declined to less than one-half the 1980-82 rate in central city counties, while growth rates remained relatively strong in suburban counties of the State.

The pervasiveness of the slowdown in Texas population growth and in the rate of net migration is particularly evident when viewed graphically. As the data displayed in Figures 1 and 2 suggest, by 1984-85, the number of the State's counties that showed patterns of population decline and net outmigration not only increased but had also become evident in nearly all parts of the State. Except for central Texas, very few parts of the State were not experiencing a slowdown in population growth by 1985. Further evidence related to individual county patterns can be obtained by examining the data in the Appendices.

Summary

The data in this report clearly show that the pattern of slowdown in Texas population growth noted in last year's report (Murdock and Hwang, 1986) has become even more evident in the data for 1985. The annualized rate of growth for 1984-85 was only 1.8 percent, and 1.2 percent of this growth was due to natural increase. By 1985 the State's rate of population growth had declined to a level reminiscent of the 1960s (when the annualized rate of growth was 1.7 percent), and a majority of the State's counties were showing patterns of net outmigration. Only relatively high rates of natural increase offset net outmigration to produce population growth in a majority of the State's counties. For the State's metropolitan areas, the patterns have no recent historical precedent; for even during the 1960s, most of the State's metropolitan areas experienced net inmigration. By 1985, however, 65 percent of the State's metropolitan areas were showing net outmigration, although only 6 did not have rates of natural increase that were sufficiently high to offset net outmigration and thus to enable the areas to show population growth rather than decline. The State's most rural counties are experiencing population loss, with only

suburban counties retaining patterns of relatively rapid growth. Finally, nearly all regions of the State are experiencing both patterns of slowdown in population growth and an increasing rate of net outmigration.

Although, we must, as in last year's report, caution the reader that the trends we have described are based on U.S. Census Bureau population estimates, not on actual population counts, and that trends for only a few years may be misleading, there appears to be little doubt that the slowdown in Texas population growth is real, extensive, and pervasive. The causes for these patterns appear to be largely economic, and it seems unlikely that such growth will return to the levels of the 1970s and early 1980s until the Texas economy shows a substantial recovery.

Table 1

Annual Population Change in Texas, 1980-1985

Year**	Population	Numerical Change From Preceding Year	Percent Population Change From Preceding Year
1980	14,228,000	303,000*	2.7%*
1981	14,736,000	508,000	3.6
1982	15,279,000	543,000	3.7
1983	15,724,000	445,000	2.9
1984	16,083,000	359,000	2.3
1985	16,370,000	287,000	1.8

*Annualized for 1970-80

**All post-1980 estimates are for July 1 of the year noted. Population values for 1980 are for April 1, 1980.

Table 2

Annual Net Migration, Net Migration Rates, Natural Increase Rates and Rates of Population Change in Texas, 1970-1985

	Annual			
Year	Net Migration[1]	Net Migration Rate (%)	Natural Increase Rate (%)	Percent Population Change
1970-80	177,000[2]	1.6	1.1	2.7
1980-81	298,000	2.1	1.5	3.6
1981-82	364,000	2.5	1.2	3.7
1982-83	262,000	1.7	1.2	2.9
1983-84	178,000[3]	1.1	1.2	2.3
1984-85	101,000	0.6	1.2	1.8

[1]Calculated as a residual using birth and death data from the Texas Department of Health. Because the birth and death data used in the calculations in this table have been updated from those used by the U.S. Bureau of the Census in its population estimates, net migration values shown in this table differ slightly from those shown in U.S. Census Bureau publications and in Appendices A-C which use U.S. Census Bureau estimates of net migration.

[2]Annualized for 1970-80.

[3]Includes for the first time U.S. Census Bureau estimates of approximately 49,000 undocumented aliens in Texas as of 1984. If such aliens are removed from the total, net migration for the State of Texas from 1983-84 would be approximately 129,000 and the net migration rate would be 0.8% and the percent population change would be 2.0%.
